

Overall structure: one public learning ground

01 / OVERALL SPATIAL THESIS

THE UNFINISHED CITY: ONE PUBLIC GROUND, REVISED TOGETHER

Not a finished masterplan: the inherited corridor becomes a visible, contestable and revisable public ground.

CENTENNIAL JING-ZHANG / CONCEPTUAL

PUBLIC LEARNING GROUND

railway memory, shade, rainwater and walkable care are the fixed substrate

AI IS DISTRIBUTED

assistance appears at thresholds along the public ground, never as a single isolated object

Spatial facts retained in this English mirror: one site constraint / three cores / two transition nodes / one continuous public axis.

PROVISIONAL CONSTRAINT

Conceptual boundary only.
Recalculate areas and ratios
when verified geometry arrives.

One continuous public learning ground links the three key areas: open training at Zhongzhiyuan, everyday learning at AI Origin Community, and explainable service at Dazhongsi. Two violet transition nodes make knowledge, life and service a reversible spatial process.

A mixed conceptual land-use fabric

02 / LAND-USE STRUCTURE

A MIXED, ADAPTABLE FABRIC — NOT A COLOUR-BLOCK MASTERPLAN

The English mirror keeps the same embedded fields, public axis and three-core relationship as the Chinese plan.

CENTENNIAL JING-ZHANG / CONCEPTUAL

LAND-USE LOGIC

public ground • adaptable floors • daily support • testing interfaces • ecological repair

Conceptual mix derived from the provisional geometry; it does not state statutory land-use controls. The violet field is a transition interface, not a fourth sealed district.

Land use is mixed, interwoven and adaptable. All ratios are internal calculations from the provisional constraint and do not state statutory land-use controls, intensity or approval outcomes.

Three key areas, three urban protocols

The three key areas are not generic AI hubs. They work as three different urban protocols: an open training court, an everyday learning street and an explainable service threshold.

Public ground and service corridor

04 / PUBLIC GROUND + MOBILITY

PUBLIC GROUND IS NOT A LINE, BUT FOUR LAYERS KEPT APART

Railway memory, rain, slow walking and restricted service share one continuous route without competing for the human scale.

The technical layer stays at the edge. The middle belongs to walking, shade, staying and the visible right to pause or take over service.

The left plan and right critical section are a single paired argument: continuity in plan, separation and care in section.

FOUR-LAYER LOOP / CONTINUOUS PUBLIC GROUND

FIG 04 / PUBLIC GROUND: FOUR LAYERS RUN IN PARALLEL AND TRANSFORM AT NODES.

CENTENNIAL JING-ZHANG / CONCEPTUAL

CRITICAL SECTION

FOUR LAYERS, ONE HUMAN-FIRST SCALE

Green = ecological repair; blue = people; rose = memory; yellow = edge service.

Service never compresses walking

The public ground remains a human right of way.

Railway memory, walking, rainwater, shade and the service edge form one public ground. Technical service cannot displace walking, staying or human takeover.

Scenarios, identity and long-term operation

Unfinishedness is made operational through ten scenario cards, visible pause-and-appeal interfaces, annual open days and cross-city retrospectives. The identity system — The Unfinished City — combines a revisable rose public axis, three coloured fields and violet transition nodes.

Metrics, recalculation and risk boundaries

The 12.0714% green-space and 14.2495% public-space ratios are recalculated from the submitted provisional geometry. When verified geometry or controls are released, layers, metrics, drawings and the visual page must be regenerated.
