

Method before sites | How AI Agents enter urban planning

CORE METHOD

AI does not merely add images to conventional planning. It creates a traceable and correctable judgement chain across evidence, value, space and operations.

This board records planning reasoning and human correction; concept images, provisional boundaries and candidate Agents are never presented as deployed facts.

Evidence-led planning: one belt, three cores, two wings

FIG. 01

Relationship diagram, not a statutory map. The same IDs feed the report, JSON, HTML and review gates.

Stable public base + reversible scenarios + human takeover

FIG. 02

AI-native planning changes the unit of design from a fixed facility to a versioned, stoppable service bundle.

Three focus areas × six first moves

FIG. 03

Each point is a service/spatial prototype with a clear status, not an unverified site placement.

From research contract to a real controlled pilot

Two pre-G2 evidence gates | current: 6 blocked; public co-definition not_started

Mobility, blue-green and public-service continuity

FIG. 04

A service blueprint avoids drawing a road alignment before official transport and park data are supplied.

USER JOURNEY

Mobility layer	walking / bicycle / transit / accessible path known / unknown / next evidence
Blue-green layer	rail heritage / stream / shade / rest known / unknown / next evidence
Public-service layer	paper route / staffed desk / quiet fallback known / unknown / next evidence

No station, road, park or heritage boundary is inferred from this diagram.

NTS / conceptual proposal / provisional geometry / not deployed

Metrics are a feedback loop, not a dashboard ornament

FIG. 05

Unknown baselines stay unknown; every candidate metric has an owner, trigger and stop/restart action.

Baseline

unknown until field/data owner

Trigger

recompute after geometry/version change

Action

keep / adjust / pause / exit

NTS / conceptual proposal / provisional geometry / not deployed

Five shifts: from a linear plan to a learning planning system

FIG. 17

AI changes planning only when evidence, judgement, scenarios, implementation and feedback become traceable and correctable.

JINGZHANG STRESS TEST
heritage slow variables × AI fast variables × everyday public life × incomplete evidence → traceable | correctable | take-over ready | reversible | accountable

Planning method diagram | human decision required | not statutory approval

Five-dimensional planning object for the AI era

FIG. 18

Land use remains the public base; task, interface, time and governance contracts become explicit planning layers.

SCENARIO CONTRACT

SPACE

+

TASK

+

INTERFACE

+

TIME

+

GOVERNANCE

If a variable layer exits, access, rest, accessibility and ordinary services must still work.

Planning method diagram | human decision required | not statutory approval

One identity, six naming levels, three reversible mark studies

FIG. 12

The Evidence Line is a candidate visual grammar, not a registered logo. Naming levels, rights and withdrawal rules remain explicit.

Four complete scenario cards show the AI-human-fallback contract

FIG. 13

Thirteen cards share the same fields; four are expanded here to make entry, measurement and stop rules immediately legible.

Three cultures, five route prototypes, one correction loop

FIG. 14

The three cultures are a planning narrative task. Contemporary links are interpretive proposals, not a direct historical causal chain.

Fifteen professional contracts: complete research interface, not sign-off

FIG. 15

Each depth item points to a distinct paragraph, layer, metric, gap and recomputation trigger; unknown controls remain visible.
